Abstract (en)  
[origin: WO02064927A1] The invention relates to a closing sequence control device for a self-closing door comprising a fixed wing and a moveable wing. Said moveable wing can be fixed by means of a locking mechanism which can be released by the fixed wing. The aim of the invention is to create a mechanical closing sequence regulating device which ensures a reliable door closing sequence, is visually appealing and has as few outer components as possible, said components not protruding past the door plane. To this end, the fixed wing is provided with a cam plate (5) which co-operates, by means of an actuating element (7), with a brake (9) acting on the moveable wing.
