Abstract (en)

A weft feeder for weaving machines, provided with a device for separating the loops on a loom cylinder, comprises a motor housing (11) and a loom cylinder (12) on which a swivel arm (13) operated by a motor winds a plurality of yarn loops (F) forming a weft reserve. The swivel arm (13) is shaped as a rectilinear tube (13) and obliquely projects from a hub (14) keyed to a hollow driving shaft (15) through which the thread (F) runs.
