Abstract (en)
[origin: WO02078995A1] The present invention relates to a device at gear levers for manoeuvring a gear box for a motor vehicle and consisting of a lever console (3) and a pivoting lever (2) that is applied in the console, which is arranged to be manually shifted between different gear positions for corresponding change of the gear box between different gear conditions. The lever is thus pivotally mounted by means of a ball and socket joint in the form of a joint ball(7) which is pivotally journaled in a joint socket (8) which is applied to the console. Further, the lever is connected with the joint ball and, in at least one gear position, displaceable in its longitudinal direction relative to the lever console. The ball and socket joint is movably suspended in the lever console (3) and arranged to follow the longitudinal displacement movement of the lever between an upper position and a lower position.
