Abstract (en)

[origin: WO02077390A1] The invention relates to the construction and use of an auxiliary assembly device for fixing a wall or ceiling strapping, for example a lath or metal rails and the like in an aligned assembly plane. According to the invention, the auxiliary assembly device consists of a U-shaped receiving part (1) having two U-shaped legs (1.2) for receiving a straightedge or various assembly elements inside or outside the U-shaped receiving part; at least one suspension part (2) bent at a right angle relative to the extension of the U-shaped legs (1.2) and in the direction of the longitudinal extension of the straightedge (3) that is inserted into the U-shaped receiving part (1) and the like, said suspension part engaging on one end of the U-shaped leg (1.2) of the U-shaped receiving part (1) and being provided for engaging the lath or metal rail and the like (4) from the back, wherein a fixing device (5) is placed which engages the central area (1.1) of the U-shaped receiving part (1) and which presses the straightedge (3) or various assembly elements inside or outside the U-shaped receiving part against the strapping (4) and fixes them with the aid of the auxiliary assembly device. The fixing device (5) has a perforated plate (8) with holes (9), wherein the perforated plate is guided in a height adjustable manner on the parallel U-shaped legs (1.2) by means of said holes (9) and serves as bearing surface for the straightedge or the various assembly elements inside or outside the U-shaped receiving part.
