Abstract (en)
A bag 1 consists of two superposed bag sides 2, 3. With the purpose of achieving a particularly simple carrying handle in a bag with substantial reduction of material, a carrier section 4 is formed by a side edge 5. The carrier section 4 is connected with an adjacent bag side 3 by means of connecting zones 7 which delimit a pocket 8 having a downwardly facing opening 9. The pocket 9 thus constitutes a carrying handle for accommodating the user's fingers when carrying the bag. Due to distribution of tensile forces from areas 12 at the pocket opening, it becomes possible to achieve great strength even when using film material which is thin compared with traditional thickness. <IMAGE> <IMAGE>
