Abstract (en)

[origin: DE10116706A1] The invention relates to a method and a device for operating a centrifugal spinning and twisting frame (1) comprising a plurality of identical spinning points (2), each having an individual motor-driven spinning centrifuge (8), a yarn carrier tube (7), which is mounted so that it can be displaced vertically in relation to the spinning centrifuge (8), in addition to its own computer (14). According to the invention, at the start of the spinning process for a new yarn, or a yarn for which the frame parameters are to be modified, at least one of the yarn body parameters is determined by means of at least one reference spinning point (3), which has a sensor device (17) that is connected to a data determination and evaluation device (13), said parameters being (average structural density ρ (R)), minimum internal radius (R(min)) and maximum cone taper (gamma KZ (max)) of a yarn body (21) that forms on the internal wall (20) of the spinning centrifuge (8) of the reference spinning point (3). The frame parameters of the "normal" spinning points (2), for example the traversing motion of the yarn carrier tube (7), are then adjusted accordingly.
