Abstract (en)

[origin: WO02084043A1] In a locking assembly for a ventilating window comprising a locking control mechanism connected with an operator member (4) via an actuator slide (13) release of locking engagement between movable and stationary locking members (11, 7) may be blocked by blocking means (26) acting on the locking control mechanism and/or the actuator slide (13). The blocking means (26) is selectively operable by user operated means functionally integrated with the operator member (4) for displacement between a blocking condition, in which the slide (13) is blocked against displacement from an intermediate locking position to a first end position, and a non-blocking condition, in which the slide (13) is freely displaceable by operation of the operator member (4).
