Abstract (en)
[origin: WO0164295A2] The invention relates to a glove (1; 1'), especially a goalkeeper's glove, having jointed support elements (4; 4'; 5). The individual pre-manufactured elements (41; 41'; 51; 51') making up the jointed support elements (4; 4'; 5) extend across the longitudinal direction of the support elements (4; 4'; 5) or the finger over the backs of the fingers and are coupled to each other by pull elements (42;43) or by means of another jointed connection. As a result, no resistance or optionally only a desired resistance to deformation from the initial position of the glove (1) is created and the finger joints can be better protected. The inventive glove (1; 1') can also be better adapted to the curves of the fingers and is characterized in that it offers effective protection against finger injuries or hand injuries, despite being extremely comfortable to wear. It provides better grip and helps the goalkeeper catch the ball better, in addition to increasing the defence skills of the wearer.
