Abstract (en)
Disclosed is a shift locking apparatus for an automatic transmission, in which a lock cam (10) connected to a shift lock cable (50) and a key lock cable (60), respectively; latching means (20) causing the lock cam to be in a latched or unlatched state depending on an engaged or disengaged state of the brake pedal (70); a casing (30) housing the lock cam and the latching means therein to be fastened to a vehicular chassis; and a shift lock pin (40) cooperating with the lock cam via the shift lock cable to lock or release the shift lever (80) in or from a parking position; whereby highly expensive components such as an electrical shift locking apparatus are not required and a relatively simple structure is attained so that an overall production cost can be saved, and a normal operation is performed even when an electrical trouble, for example a battery discharge, is generated and thus reliability and safety of products are improved. <IMAGE>
