Abstract (en)
[origin: EP1378784A1] A transfective liquid crystal display comprises a first substrate having a transparent electrode, a second substrate having a transfective electrode on which a region having a reflection function is formed and a region having a transmission function is formed, a homogeneously oriented liquid crystal layer sandwiched between the first and second substrates, a first optical anisotropic element arranged on the surface of the first substrate opposite to the surface contacting the liquid crystal layer, a polarizer arranged on the first optical anisotropic element, a second optical anisotropic element arranged on the surface opposite to the surface of the second substrate contacting the liquid crystal layer, and a polarizer arranged on the lower surface of the second optical anisotropic element wherein said second optical anisotropic element comprises at least one sheet of liquid crystal film obtained by fixing a nematic hybrid orientation formed by a liquid crystalline polymer exhibiting an optically positive uniaxial property, in a liquid crystal state. The transfective liquid crystal display provides a bright image with high contrast in the transmission mode and is excellent viewing angle properties. <IMAGE>
