Abstract (en)

[origin: WO02086384A2] The invention relates to a device for connecting a first optical component to a second optical component, particularly for connecting the lamp housing of a spotlight to a lamp adapter. Said inventive device comprises a connecting ring (2) which comprises a first region (22) which rotatably secures the connecting ring (2) to the first optical component (1), and a second region (21) which is axially distanced from the first region (22) and enables the connecting ring (2) to be connected to the second optical component part (3). Said second region (21) comprises coupling means (25), which engage with corresponding coupling means (31, 31a) of the second optical component (3) by rotating the connecting ring (1). The invention enables two optical components to be connected in a fast, simple manner.
