Abstract (en)
[origin: WO02087030A1] The invention relates to a lamp holder comprising a glass vessel and a base, particularly for a discharge lamp. The holder comprises a bushing for receiving the base and a means for locking the base into the bushing. The locking means comprises at least one spring element (2) and at least one locking part (3) which can be displaced between a first and a second position relative to the spring element (2). In the first position, the contact locking part (3) enters into the spring element (2) in such a manner that said spring element is placed under tension and is pressed against the base of a lamp disposed in the bushing (12). In the second position, the spring element (2) is exposed to either no pressure or to a reduced amount thereof. According to the invention, it is possible to position a lamp in a precise position in the holder even during the transportation and operation thereof.
