Abstract (en)

[origin: EP1380701A1] Joint (1) for forming a T-connection between two sections (2,3) having a substantially quadrangular cross-section and both being provided with a chamber (4,5). The joint (1) can be inserted inside the chamber (5) of one (3) of said sections (2,3) and is formed by a body (6) comprising a front facing plate (7) provided with a guide hole (8) for a pin (9) provided with a stopping flange (10); the stopping flange (10) bears against the internal surface of said front plate (7). The pin (9) is slidable towards the outside of said front plate (7) and can be inserted inside a hole (11) of the other section (2). <??>The body (6) comprises a section portion (12) having a substantially quadrangular cross-section delimited by said front plate (7), by a rear plate (13) and by two side surfaces (14,15). <??>Moreover, the body (6) can be constrained inside said chamber (5) of one (3) of the two sections (2,3) by means of locking means (16) arranged outside said section portion (12). <??>The locking means (16) comprise a tongue (17) which forms, with one (15) of said side surfaces (14,15) of said body (6), a groove (19) inside which splaying means (18) can be inserted so as to move away said tongue (17) from said side surface (15) without deforming said portion (12) of the body (6). <IMAGE>
