Abstract (en)
[origin: EP1380704A2] Cross connector (1) comprises a clamping arrangement on the under side and a holding profile on the upper side, a keyhole-like recess (5) corresponding to the holding profile (16) of the clamping profile (15), and a bending section for bending over one side of a C-profile. The sides formed by the recess are bent from a base surface (2) so that they are received between the holding profile of the clamping profile when the cross connector is placed with its base surface parallel to the base surface of the clamping profile to rotate the cross connector by 90degrees. Preferred Features: The sides are bent at the same distance which is less than the diameter of the holding profile.
