Abstract (en)

[origin: WO02085753A1] A device for the orderly, controlled unwinding of an electric wire (16) wound on a drum-like reel (11) consisting of a central sleeve-shaped reel core (11a) with a large annular flange (11b, 11c) at either end, also comprising, besides the reel (11), a box-like support (10) and a support device (12, 12a) for the rotatable support of the reel (11) inside the box-like support (10) which has at least one outlet/inlet opening (13) for the wire. To allow excessively unwound wire to be pulled in and rewound while the reel (11) is in the support box (10), at least one flange is formed with small holes (14) distributed along an imaginary circle whose centre coincides with the axis of rotation of the reel. At least one support box side wall is formed with a transversely elongate opening (15), through which for example three adjacent holes (14) are accommodated at any time during the rotation of the reel (11), thus being accessible to the user who is to take care of the rewinding of wire let out. The holes (14), hole edge portions and adjacent surface portions accessible through the opening (15) form grip-enhancing, friction-increasing hold portions opposite the user's fingertips.
