Abstract (en)
[origin: EP1386867A2] A device for rolling up a web of elastic material in sheet form, comprises a frame, a rolling-up member (2) having an essentially regularly curved support surface (11) that is mounted on the frame such that it can rotate, drive means for making the rolling-up member (2) rotate and securing means (7,8) for securing one end of the material in sheet form that is to be rolled up to the rolling-up member (2). The securing means (7,8) comprise two clamping jaws that are oriented axially with respect to the support surface (11) and can be moved between an open position for inserting or releasing the material in sheet form and a closed position for clamping the material in sheet form, in which open position the clamping jaws enclose a slit-shaped opening in the support surface (11). <IMAGE>
