Abstract (en)
[origin: EP1387134A2] The device is in the form of an injection-molded part (1) whose material essentially contains 3 components, namely a polymer, a channel formation and a molecular sieve. The molecular sieve is inserted into the polymer material and/or in channels passing through the polymer material. The injection-molded part is in the form of a dense cylindrical part whose cross-section is matches the collector (12. Independent claims are also included for the following: (a) the use of an injection molded part for drying coolant in a coolant circuit for an air conditioning system, especially for motor vehicles (b) a collector for coolant in a closed circuit, especially in a coolant circuit for an air conditioning system (c) and a heat exchanger, especially a condenser.
