Abstract (en)

[origin: WO02085165A1] This invention describes a type of mattress intended to relieve the pressure that is applied to protruding body members during sleep. This mattress includes cavities into which protruding body parts (shoulder, arm, hip) enter and rest. This way, these parts are not overly pressured during the course of sleep, resulting in comfortable and restful sleep. The same principle applies to protrusions, which are added to the mattress and support concave members of the human body.
