Abstract (en)

[origin: WO02090686A1] A device serving for mounting a gutter (13) on a building. The device comprises at least one rail (15) mounted on the building wall or fascia (17) and extending in a substantially horizontally extending direction, and a number of spaced apart gutter brackets (14) made of e.g. strip iron and each having a first section (18) for fixing the gutter bracket (14) on the rail (15) and a substantially arcuate second section (19) for supporting the gutter (13). Means (26) on the first section (18) of the gutter bracket (14) are serving for movably engaging with, respectively, an upper longitudinal groove (23) and a lower longitudinal groove (25) designed in rail. A nut (27, 35) is serving for tightened said first section (18) on the rail (15) by means of at least one screw (28). By means of the device according to the invention, the gutter brackets (14) for supporting the gutter can be mounted quickly and easily on e.g. a building wall or fascia.
