Abstract (en)

[origin: WO02072987A1] The invention relates to a recognition device which is used to control the unlocking of vehicle openings and/or to authorise the start-up of the vehicle. Said device comprises a first emitter which, on command, can send a first user identification signal over a carrier wave having a given first frequency (nu 1) to a receiver. The inventive device also comprises a second emitter which can emit at least one second user identification signal over a carrier wave having a second frequency (nu 2) which is different from the first frequency such that the second signal can act as an identifier signal in the shadow zones where the first signal is not recognised.
