Abstract (en)

[origin: WO02084601A1] The invention relates to a device for activating user-specific settings. Said device comprises at least one fingerprint sensor (10), whose sensor signal (12) is compared by a signal evaluation unit (14) with at least one piece of reference information (U1REF, U2REF, UNREF) in order to identify the user. At least one setting (E1, E2) for a settable component (24) is assigned to at least one user. A controller (20) activates the settable component (24) according to the setting (E1, E2) that is assigned to the identified user. The device is provided with identification elements (10, 14), which detect the presence of a finger on the fingerprint sensor (10), whereby the activation of the settable component (24) is dependent on the detection of the presence of a finger.
