Abstract (en)

[origin: WO02093602A1] The invention relates to an operating device (1) comprising a rotatable crank drive which can be actuated by repeatedly pressing and releasing a push-button (4). The push-button (4) is thus alternately fixed in an operating position, i.e. the out position, and a locking position, i.e. the pressed-in position. A rotatable locking ring (9) which can be axially displaced in an elastic manner and the housing (8) of the operating device (1) comprise crank elements (10, 11) which are alternately distributed around the circumference, and in which the push-button (4) can be securely locked in a precise position.
