Abstract (en)  
The invention relates to a nestable crate comprising a base. Side walls (3,4,5,6) stand transversely of the base. These side walls have a free upper edge (7). The crate comprises at least a first stacking member (12) which is arranged close to the base and which can support on a second stacking member (13) when the crates are stacked, which second member is arranged close to the upper edge in the line of the first stacking member. The second member is provided with a support means for stackably supporting crates in a stacked state and nestably receiving crates in a nested state. The invention is characterized by support means which is movable substantially parallel to the plane of the side wall. <IMAGE>
