Abstract (en)

[origin: FR2820871A1] The invention concerns a method which consists, prior to applying a high frequency pulse train (TSY) between the two electrodes of a pair of electrodes X, Y, borne by a faceplate, in applying at least a holding pulse SHX, SHA between an electrode X of said pair and an electrode A of another faceplate of the panel. Since the holding discharges DH are not generated between the same electrodes as the stabilised discharges DS, the electrodes X, Y can be spaced apart so as to lower the stabilisation frequency without increasing the holding voltages.
