Abstract (en)

[origin: EP1391405A2] A sheet material guiding mechanism for guiding the edge portion of sheet material (P) comprises a movable side guide (23) capable of sliding corresponding to the sizes of sheet material (P), and being fixable in any position within the sliding area; a sheet guide section (231) provided for the movable side guide (23) in order to regulate the position of sheet material (P) by butting against the edge of the sheet material (P); and an innerside operating section (234) provided for the movable side guide (23), being capable of releasing the fixed condition of the movable side guide (23) by depression, hence making it possible to provide a sheet material guiding mechanism having a simple structure at lower costs, and producing the suppression effect against the skew of the sheet material (P) with the easy operation that copes with disability. <IMAGE>
