Abstract (en)
A composite floor structure comprises a profiled steel deck which is bordered on its sides with edge sections to define a framework which is filled in situ with concrete. The profiled steel deck comprises upper and lower generally horizontal flange surfaces joined by downwardly and outwardly inclined straight or curvilinear web surfaces and edge laps extending outwardly from sides of the steel deck. The edge sections each comprise an upstanding web from the upper margin of which projects a first flange which assists in determining the level of concrete required to cover the deck. A second flange is provided to which is secured or on which is mounted a longitudinal edge lap or side of the deck. <IMAGE>
