Abstract (en)
[origin: EP1394339A2] Multi-story car park made of pre-fabricated concrete parts comprises self-supporting support plates (5) arranged in rows in individual floors which are held at each end in a vertical support construction and are fixed at each end to the support construction in a torsion-resistant manner. The supporting plates have a length corresponding to a 6 m roadway and two parking places and a width corresponding to a parking space width. Non-supporting longitudinal regions are formed by displacement bodies (65, 65A, 65B) in the lower region of the square-shaped support plate between longitudinal and edge-side longitudinal frame ribs (61, 61A, 63, 63A) made of prestressed concrete. Bearing regions (64A-64D) and transverse passages (51) are formed on the longitudinal frame ribs and a casting joint (18) and a row of mortar pockets (18A) are formed in each of the vertical outer long sides. The casting joints and mortar pockets are filled with a plastic-coated mortar and connected by transverse screws so that the support plates of one floor are connected to form a support surface which is joined in a torsion-resistant manner at the ends to the support construction and in the second horizontal direction to the side supporting walls.
