Abstract (en)

[origin: WO02095350A1] In connection with common tyre changing machines, it is well-known to use a pressing equipment, which e.g. is placed at the side of the machine, and which can be operated with the wheel standing on the floor. This give a cumbersome working position at the positioning of the wheel and inspection of correct placing in relation to the tool, and furthermore the operator is then to lift the wheel by himself up to lying position on the work plane of the tyre changing machine. By the invention it has been found that these circumstances can be considerably improved, if the wheel is lifted up to a work table at which the necessary tools are provided and from which the wheel can be transferred from operation to operation. With a tyre line according to the invention there may be possibility of using a far more suitable arrangement ergonomically, for lifting, handling, as well as for taking down the renovated wheel.
