Abstract (en)
[origin: EP1396212A1] The movement of the extension (10) is influenced by control means which have a swivel lever (14, 15) which can pivot about a pivotal axis (12, 13) and which is fixed on the cupboard element (1) and extension (10) respectively and can be pressed against a roller (22, 23) by spring means (16). The swivel lever has a control path (19) on which the rollers roll at least during part of the slide in movement of the extension into the cupboard element. The control path has a pull-in region (20) which pulls the extension into the rear end positioning the cupboard and has an ejection region(21) which ejects the extension during its outward movement.
