Abstract (en)
[origin: EP1396453A2] The roll winder has at least one support roller (4) which has an elastic lining on the surface and by which the material web roll in operation forms a nip. The influence of the elastic lining is adjustable to the hardness of the material web roll. The effective hardness of the elastic lining is variable. The penetration depth of the material web roll into the support roller is variable. The elastic lining has compensating spaces, the size of which is variable. The lining may be divided into several sections in the axial direction, with compensating spaces between them.
