Abstract (en)

Method for determining the arm length (b) of a workpiece that has been bent with a bending tool and has two arms (13, 14) that joint at an apex (S) and have a defined bending angle (beta). According to the method the position of the apex and the end (E) of the arm are determined and the distance between them then calculated. An Independent claim is made for a device for determining the arm length of a bent workpiece. The invention also relates to a corresponding device for bending workpieces, especially metal plates, that is equipped with an inventive measurement device.
