Abstract (en)

A circuit board (6) receives locking or unlocking signals from a remote controller and rotates a motor (5) in clock wise or anticlockwise directions together with an actuating element (7) for moving a passive element (8) outwardly or inwardly. The passive element compresses or expands a spring (9) for engaging or disengaging a dead bolt (83) from a groove (30) of a base (3), to finish locking or unlocking of the lock.
