Abstract (en)

[origin: EP1398450A2] The body of the plaster rail (30) has a flat base upon which is fitted an adhesive strip for the fastening of the plaster rail to the side surface of a component part such as a roller blind rail (14). An extension projects from the base to overlap a front-side edge region of the component part. A spacer is provided on the rail's base side opposite the adhesive strip. A fabric reinforcing section (40) is fastened to the plaster rail in the transition region between the base and spacer, with a distance (d) between the position in which the reinforcing fabric leads away from the rail body and the end of the spacer element facing away from the base.
