Abstract (en)
[origin: WO02095223A1] The wind turbine, in particular serving for the generation of electric power, has a rotor (W) placed on a tower (H) equipped with a sleeve (1) mounted so that it may rotate via bearing (2) on the foundation (F) fixed in the ground. The tower (H) is fixed to the sleeve (1) via bearings (3) mounted on the pins (4) attached to the sleeve (1). The tower (H) is rigidly connected by an auxiliary beam (13) with the main beam (7) at the angle of 50 to 120, the other, free end of which is suspended at the top part of the tower (H) on a rope (8), and has ballast (9) fixed underneath with a coupling (10) and to the main beam's (7) bottom is fastened the end of the rope (11) wound on a reel (12) attached to the ballast (9) to which the tower's (H) rotary mechanism (M) is attached.
