Abstract (en)

[origin: DE10229006A1] The method involves generating first coded bits by encoding k input bits into 32 bits. A (3k+1)-bits is output by puncturing the first coded bits according to a specific mask pattern corresponding to the k. Second coded bits are generated by encoding the (10-k) input bits into 32 bits and outputting a {\*(10-k)+1}-bits by puncturing the second coded bits according to a specific mask pattern corresponding to the (10-k). Independent claims are also included for the following: (a) an apparatus for encoding two TFCI separated into k bits and (10-k) bits.
