Abstract (en)
[origin: FR2826805A1] The invention relates to a terminal installation for a communication network. The installation comprises a primary station consisting of a transmitting and receiving device which is installed in fixed manner on a host site and a communication treatment base which can be connected to the core of the communication network. The transmitting or receiving device exchanges one or several communications with the communication treatment base. According to the invention, the exchange of communication between the transmitting or receiving device and the communication treatment base is carried out via a power network supplying them with electric energy. The transmitting or receiving device can be remote from the communication treatment base and can, for example, be installed on a site such as an urban decor element.
