Abstract (en)

[origin: WO03001961A1] The invention relates to a vacuum cleaner which is provided with a housing cover (1) wherein a plug (4) on a cable (3) is pulled from the inside through a large opening (20) during assembly. During the assembly process, the cable (3) is pulled through a narrow slit (21) into a cable run area after the plug has been pulled through. The cable run area (22) is formed in such a way that the plug (4) knocks against the housing cover (1). During assembly of the housing cover (1), the opening (20) is sealed on a lower part of the vacuum cleaner by a component which is already mounted in said lower part, like the operating element, whereby said component performs the additional function of sealing the housing cover (1). Said construction dispenses with the need to use a separate closing part for the opening (20) once the cable (3) and plug (4) have been assembled. .
