Abstract (en)

[origin: WO03006328A1] The invention relates to a closing lower part comprising a connecting sleeve (2) and a fixing flange (3) arranged on the outer side of said connecting sleeve (2), wherein at least one projecting element (4) is provided on the inner side of the connecting sleeve (2). The projecting element is designed to retain the closing lower part (1) when it is fixed to a mandrel inserted in the connecting sleeve (2) in a container wall. In order to provide a corresponding closing lower part that can be retained with a substantially higher margin of tolerance in a mandrel, the at least one projecting element (4) has the shape of a rib that can be flexibly moved away and which extends inclined relative to the inner wall of the connecting sleeve (2) at an angle alpha that is smaller than 90 DEG and bigger than 0 DEG .
