Abstract (en)
[origin: WO03001017A1] A window (1) comprises a sash/frame structure (2, 5) supporting a pane (3), a separate ventilation opening being adapted in the sash/frame structure (2, 5) for flow communication between the exterior and interior sides of the window. A tubular valve housing (9) is inserted in the ventilation opening at the interior side of the window, the flow area of the valve housing being partially covered by a seat surface (12). A closing body (14) is journaled in the housing (9) so as to be pivotable between an open position in which the closing body (14) overlaps the seat surface (12), and a closed position in which the closing body (14) and the seat surface (12) together substantially cover the entire flow area of the valve housing (9).
