Abstract (en)
[origin: WO0231577A1] The invention relates to an information system comprising a signal detection system (350D) which detects an image of the outside world represented on the retina (380) of one eye; an information device; an output device which provides information in conjunction with the information device according to the signals thus detected. The signal detection device comprises a scanning device (350D) which detects at least partially retinal reflex images of the retina. The provision of information does not contain any information projections onto the retina.
