Abstract (en)  
[origin: WO02091868A3] The invention concerns a device for fixing the fastener of sport shoes with studs or spikes. It enables to fasten the sport shoe more easily, and to adjust each fastening point, while preserving the shoe's performance, enhancing appearance, maintaining a planar surface avoiding excess thickness. The device for facilitating fastening of sport shoes of the self-adhesive strip fastener type, comprises a right upper (1) and a left upper (6), having at least three eyelet buckles (4) for passing through the adhesive strips. The invention is characterised in that the right and left uppers comprise cut-outs which constitute recesses, and beneath the right upper (1) is secured by stitching, by bonding a piece whereon are fixed at least two eyelets formed respectively by a buckle (4) which is maintained by a fixing piece (3), beneath the left upper (6) is fixed a piece whereon are sewn at least two self-adhesive strips including respectively a locking part (8) and a looped adhesive part (9), the eyelets and the strips integral with the respective pieces are less thick than the uppers (1 and 6) and are positioned so as to correspond to the indentations of said uppers. The invention provides a novel shoe model which is more fashionable.
