Abstract (en)
[origin: EP1408292A1] A hydraulic block has two passages (26,27) which transport central heating water between a primary heat exchanger and a feed line or a return line of a central heating system. A valve connection (33,34) is closed off when a secondary circuit is connected to a primary circuit. A branch connection transport central heating water between first passage and secondary circuit. An independent claim is also included for a method for producing at least one heating device.
