Abstract (en)

The curtain is connected to an arm (5) having a ring (6) disposed at the end thereof which is mounted to rotate freely on a support (10). The flat ring is provided with toothing (7) by means of which said ring receives the movement of a micromotor (9) which causes the curtain to move between the operation and non-operation positions, said positions being defined by a pair of mechanical stops (11-11') or by the electronic control of a step-by-step-type actuation motor.
