Abstract (en)
[origin: WO03008057A1] A card-like game device (2) includes a play push-button (4), a hold push-button (6) and a lock push-button (8). Five display windows (10) and five corresponding display windows (12) are spaced along the device in two parallel straight lines. The device is powered by batteries or solar cells (14) and the window (16) displays relevant information. To play the game the player chooses five numbers which are displayed in the windows (12). The lock button (8) is pressed to unlock the device, and the play button (4) is then pressed to start the game. Numbers move across the display windows (10) until numbers come to rest in sequence in all the windows (10). If a number in a display window (10) matches a number in the corresponding window (12) this is classed as a win. Any winning number in the windows (10) can be held and rolled over into the next game by pressing the hold button (6). Alternatively the lock button (8) can be pressed to retain any winning number in the windows (10) and to prevent any further games being played.
