Abstract (en)
[origin: WO0144084A2] The invention relates to a device for conveying discrete entities, comprising a rotary support (14) bearing a telescopic transfer arm (10) having a multi-directional head. The extension of the arm (10) and the orientation of the gripper head (28) are controlled by cams according to the angular position of the arm (10) around the axis of rotation (A0) of the support (14). The invention is characterized in that the extension of the arm (10) and the orientation of the gripper head (28) are controlled by a single tipper (34) which is hinged on the outer radial part (18) of the arm and which comprises two cam followers (36, 38) which cooperate with an independent cam path (40, 42).
