Abstract (en)

[origin: FR2794731A1] The invention concerns a conveyor system for discrete entities, comprising a gathering member (36) supplied by at least two upstream units (26, 27) each of which brings to the gathering member a series of entities (11, 13), and wherein the entities leave the gathering member in a single line. The invention is characterised in that the gathering member comprises a gathering wheel (36) driven in rotation and provided with several slots (38, 39) emerging radially at the periphery of the wheel for receiving each an entity, and the slots of a common series have the same radial depth, the series of slots being differentiated by the depth of their slots, and each series of slots is associated exclusively with an upstream unit.
