Abstract (en)

[origin: FR2825655A1] A trolley (5) has a drum (9) actuating an arm (10) which can adopt supple and rigid positions and has an implement (12) connected to it via an articulated joint (17). The drum can be rotated about the trolley's lengthwise axis, deploying the arm beyond it and in a lateral direction. The tool is connected to a flexible seal, and its support (11), which has a conical recess for a matching tool shank, has spring-loaded claws for gripping a surrounding structure. The rigidity of the arm is produced by one or two lateral chains which are rigid in one direction.
