Abstract (en)

[origin: WO03012360A1] The invention relates to a hand firearm (45) consisting of at least one magazine provided with a housing with a front and rear wall (1,3) in addition to an upper opening for the emission of sharp bullets. The distance between the outer surfaces of the front and rear walls (1,3) corresponds to the dimensions of the magazine-receiving element (47) of the hand firearm (45) and the distance between the inner and outer walls (1,3) is directed towards receiving a sharp bullet (39). In order to prevent sharp bullets from being loaded into the hand firearm (45) during maneuvers, an additional maneuver bullet magazine is provided, whereby the distance between the inner and rear walls (1,3) for receiving the bullets (35) is shortened, at least in the region of the opening, to a length which is less than the length of a sharp bullet (39) but which is long enough to receive a manoeuvre bullet (35) which is shorter than the sharp bullet (39).
