Abstract (en)

[origin: FR2815424A1] The invention concerns in particular a device with known laser equivalent surface, characterised in that it comprises a lens (2), a mirror (3) arranged so as to form at least an optical axis (OZ) for the device and means for adjusting (5) the distance separating the lens (2) from the mirror (3).

[origin: FR2815424A1] Device with a laser equivalent surface that is precisely known is suitable for measurement of the behavior of an active detection device. Said device comprises an objective (2) and a mirror (3) arranged to form an optical axis (OZ) with an image plane at a none-zero distance from the mirror. Means are provided for regulating the distance between objective and mirror. The invention also relates to a corresponding measurement method.
