Abstract (en)

[origin: WO03001632A1] An improved incandescent holder assembly is disclosed. The assembly is characterised by a novel biasing means with two downwardly extending arms, which are located around the pinch portion of the bulb. The biasing means has an outwardly extending end portion, which when depressed, causes the two arms to open outwards, away from said pinch portion so that the biasing means does not foul against the pinch portion, nor does the pinch portion obstruct the spring action of said biasing means. The radially inward force developed as result of the opening of the downwardly extending arms is approximately 75 % higher as compared to the prior art assemblies making the lamp assembly of the present invention more rigid and strong.
